	Urgent	Not Urgent
Important	• Connect to Google Calendar using OAuth 2.0 and retrieve calendar events • Allow users to specify their wake-up time, bedtime, and desired uninterrupted time block • Find and display the earliest available time slot that accommodates the requested block	• Handle Google account authentication and OAuth 2.0 token management using Google's libraries • Parse JSON responses from Google Calendar using Gson • Handle date, time, timezone, and duration calculations using Java's built-in java.time library
Not Important	• Search across customizable date ranges, such as the next 7 days or an entire month • Display multiple available time slots and rank them by availability • Allow users to specify preferred scheduling windows, such as mornings, afternoons, or evenings • Save and manage multiple scheduling profiles	• Automatically create calendar events for selected time slots • Build a graphical user interface or web application • Integrate with other calendar platforms such as Outlook or Apple Calendar • Send notifications or reminders about upcoming available time slots
